

We modernize, develop and quickly deploy new IT capabilities so you can serve people and customers better via intuitive, secure and connected systems.

AZURE SITE RECOVERY

Arrange your disaster & recovery plan

Protect your environment in the Cloud with simple automated protection & disaster recovery using Azure Site Recovery.

Through replicating virtual technologies based on rules you set and control, Site Recovery safeguards Hyper-V, VMware and physical servers where you can use Azure or your secondary data center as your recovery site.

Move replication & recovery to the Cloud

Spark new capabilities by duplicating your workloads to Azure. Applications can be migrated to the Cloud with only a few clicks, or you can temporarily burst to Azure when you come across a surge in demand. Run reports, analytics and DevTest new processes with copies of live data, then seamlessly spin your new version into production inside your data center.
